

Pivotal Phase 3 Data Show Denosumab Increased Bone Density at Multiple Skeletal Sites in Early and Later Stage Postmenopausal Women

April 2, 2008

Overall Incidence of Adverse Events Similar Between Denosumab and Placebo Groups

THOUSAND OAKS, Calif.--(BUSINESS WIRE)--April 2, 2008--Amgen (NASDAQ: AMGN) today announced the publication of results from its 24-month, 332-patient Phase 3 pivotal study in women with early and late stage postmenopausal osteoporosis in the Journal of Clinical Endocrinology and Metabolism.

In this Phase 3 study, twice-yearly subcutaneous injections of denosumab increased bone mineral density (BMD) at all sites measured, including in highly cortical areas of the skeleton. Cortical bone comprises 75 percent of skeletal mass and is a primary determinant of overall strength in vertebral and non-vertebral sites throughout the skeleton.

Denosumab treatment significantly increased lumbar spine BMD compared with placebo at 24 months (6.5 percent vs. -0.6 percent; P less than 0.0001). Denosumab also produced significant increases in BMD at the total hip (3.4 percent vs. -1.1 percent; P less than 0.0001), 1/3 distal radius (wrist) (1.4 percent vs. -2.1 percent; P less than 0.0001), and total body (2.4 percent vs. -1.4 percent; P less than 0.0001). Time since menopause did not influence the BMD response to denosumab.

Denosumab is an investigational fully-human monoclonal antibody in late stage clinical development that specifically targets RANK Ligand, the essential mediator of osteoclasts (the cells that break down bone). RANK Ligand is found in all parts of cortical and trabecular bone.

"The effect of denosumab on wrist BMD - reinforced by the BMD increases at the total body and hip regions - suggests denosumab has a positive effect on highly cortical sites," said Javier San Martin, Global Development Lead for the denosumab osteoporosis program. "It appears that RANK Ligand inhibition results in a pattern of effects on cortical bone that may be beneficial."

The overall incidence of adverse events was similar between the denosumab and placebo groups. The most common adverse events in both treatment groups were arthralgia, nasopharyngitis, and back pain.

Serious adverse events were reported for 18 subjects (11 percent) in the denosumab group and 9 subjects (5.5 percent) in the placebo group (P = 0.074). The higher incidence of serious adverse events in the denosumab group was primarily due to a greater number of subjects who had infections treated as hospital inpatients (8 denosumab, 1 placebo). However, the overall incidence of infections reported as adverse events was balanced between the two groups (60 percent denosumab, 61 percent placebo).

Types of infections in the hospitalized subjects included pneumonia, diverticulitis, appendicitis, sepsis, pyelonephritis, urinary tract infection, and cellulitis in denosumab subjects, and lobar pneumonia in the placebo subject. No opportunistic infections were reported. None of these infections were considered by the site investigators to be related to denosumab treatment. The infections were common for this subject population and responded to standard antibiotic therapy.

Amgen expects the results of its large, pivotal Phase 3 registrational study, which will evaluate denosumab's impact on fracture risk reduction, in women with postmenopausal osteoporosis, in the second half of this year.

Denosumab: Clinical Studies in Bone Loss

Underscoring Amgen's commitment to science, its researchers have created a robust clinical program for denosumab as they explore the bone biology of various diseases associated with the RANK Ligand pathway. In addition to four Phase 3 and two Phase 2 trials in postmenopausal osteoporosis, Amgen has evaluated denosumab's effects on bone erosions in rheumatoid arthritis in a Phase 2 study. In the oncology setting, researchers are evaluating denosumab in four Phase 3 and two Phase 2 studies in advanced cancer patients with, or at risk for, bone metastases. In a Phase 2 study, they evaluated denosumab as a possible treatment for patients with multiple myeloma.

Osteoporosis: Impact and Prevalence

Often referred to as the "silent epidemic," osteoporosis is a global problem that is increasing in significance as the population of the world both increases and ages. The World Health Organization (WHO) has recently identified osteoporosis as a priority health issue along with other major non-communicable diseases.

Although fractures to the vertebrae and hip are the most commonly discussed osteoporotic fractures, they do not account for the majority of fractures. In fact, fractures at skeletal sites such as the wrist, pelvis, humerus, clavicle, femur, and lower leg (tibia/fibula) make up an estimated 59 percent of all osteoporotic fractures in the United States (U.S.)(i).

The economic burden of osteoporosis is comparable to that of other major chronic diseases; for example, in the U.S. the costs associated with osteoporosis-related fractures are equivalent to those of cardiovascular disease and asthma(ii)(iii)(iv). It has been reported that osteoporosis results in more hospital bed-days than stroke, myocardial infarction or breast cancer(v).

About Amgen

Amgen discovers, develops, manufactures and delivers innovative human therapeutics. A biotechnology pioneer since 1980, Amgen was one of the first companies to realize the new science's promise by bringing safe and effective medicines from lab, to manufacturing plant, to patient. Amgen therapeutics have changed the practice of medicine, helping millions of people around the world in the fight against cancer, kidney disease, rheumatoid arthritis, and other serious illnesses. With a deep and broad pipeline of potential new medicines, Amgen remains committed to advancing science to dramatically improve people's lives. To learn more about our pioneering science and our vital medicines, visit www.amgen.com.

Forward-Looking Statements

This news release contains forward-looking statements that are based on management's current expectations and beliefs and are subject to a number of risks, uncertainties and assumptions that could cause actual results to differ materially from those described. All statements, other than statements of historical fact, are statements that could be deemed forward-looking statements, including estimates of revenues, operating margins, capital expenditures, cash, other financial metrics, expected legal, arbitration, political, regulatory or clinical results or practices, customer and prescriber patterns or practices, reimbursement activities and outcomes and other such estimates and results. Forward-looking statements involve significant risks and uncertainties, including those discussed below and more fully described in the Securities and Exchange Commission (SEC) reports filed by Amgen, including Amgen's most recent annual report on Form 10-K and most recent periodic reports on Form 10-Q and Form 8-K. Please refer to Amgen's most recent Forms 10-K, 10-Q and 8-K for additional information on the uncertainties and risk factors related to our business. Unless otherwise noted, Amgen is providing this information as of April 2, 2008 and expressly disclaims any duty to update information contained in this news release.

No forward-looking statement can be guaranteed and actual results may differ materially from those we project. Discovery or identification of new product candidates or development of new indications for existing products cannot be guaranteed and movement from concept to product is uncertain; consequently, there can be no guarantee that any particular product candidate or development of a new indication for an existing product will be successful and become a commercial product. Further, preclinical results do not guarantee safe and effective performance of product candidates in humans. The complexity of the human body cannot be perfectly, or sometimes, even adequately modeled by computer or cell culture systems or animal models. The length of time that it takes for us to complete clinical trials and obtain regulatory approval for product marketing has in the past varied and we expect similar variability in the future.

We develop product candidates internally and through licensing collaborations, partnerships and joint ventures. Product candidates that are derived from relationships may be subject to disputes between the parties or may prove to be not as effective or as safe as we may have believed at the time of entering into such relationship. Also, we or others could identify safety, side effects or manufacturing problems with our products after they are on the market. Our business may be impacted by government investigations, litigation and products liability claims. We depend on third parties for a significant portion of our manufacturing capacity for the supply of certain of our current and future products and limits on supply may constrain sales of certain of our current products and product candidate development.

In addition, sales of our products are affected by the reimbursement policies imposed by third-party payors, including governments, private insurance plans and managed care providers and may be affected by regulatory, clinical and guideline developments and domestic and international trends toward managed care and health care cost containment as well as U.S. legislation affecting pharmaceutical pricing and reimbursement. Government and others' regulations and reimbursement policies may affect the development, usage and pricing of our products. In addition, we compete with other companies with respect to some of our marketed products as well as for the discovery and development of new products. We believe that some of our newer products, product candidates or new indications for existing products, may face competition when and as they are approved and marketed. Our products may compete against products that have lower prices, established reimbursement, superior performance, are easier to administer, or that are otherwise competitive with our products. In addition, while we routinely obtain patents for our products and technology, the protection offered by our patents and patent applications may be challenged, invalidated or circumvented by our competitors and there can be no guarantee of our ability to obtain or maintain patent protection for our products or product candidates. We cannot guarantee that we will be able to produce commercially successful products or maintain the commercial success of our existing products. Our stock price may be affected by actual or perceived market opportunity, competitive position, and success or failure of our products or product candidates. Further, the discovery of significant problems with a product similar to one of our products that implicate an entire class of products could have a material adverse effect on sales of the affected products and on our business and results of operations.

The scientific information discussed in this news release related to our product candidates is preliminary and investigative. Such product candidates are not approved by the U.S. Food and Drug Administration (FDA), and no conclusions can or should be drawn regarding the safety or effectiveness of the product candidates. Only the FDA can determine whether the product candidates are safe and effective for the use(s) being investigated. Further, the scientific information discussed in this news release relating to new indications for our products is preliminary and investigative and is not part of the labeling approved by the FDA for the products.

The products are not approved for the investigational use(s) discussed in this news release, and no conclusions can or should be drawn regarding the safety or effectiveness of the products for these uses. Only the FDA can determine whether the products are safe and effective for these uses. Healthcare professionals should refer to and rely upon the FDA-approved labeling for the products, and not the information discussed in this news release.
